## Table of contents

Table of contents.....	2
List of Figures .....	7
List of Tables .....	9
Abstract.....	10
Statement of Originality.....	12
Acknowledgements.....	13
Abbreviation list.....	14
Outputs arising from thesis .....	16
Chapter 1 – Literature review .....	18
1.1. Preamble.....	18
1.2. Statement of Authorship .....	19
1.3. Normal human development .....	21
1.3.1. Placental and fetal development .....	21
1.3.2. Fetal circulation .....	21
1.3.3. The fetal brain.....	23
1.4. Lateralisation.....	26
1.4.1. Cerebral asymmetry.....	27
1.4.2. Functional lateralisation and its relationship to cerebral lateralisation .....	28
1.5. Intrauterine growth restriction in humans .....	34
1.5.1. Fetal environment, redistribution of blood flow and growth.....	34
1.5.2. Neonatal catch up growth .....	36
1.6. Neurodevelopmental effects of IUGR and neonatal catch-up growth in humans.....	38
1.6.1. Effects of IUGR on brain structure.....	38
1.6.2. Effects of IUGR on cognitive function.....	43
1.6.3. Implications of brain sparing for neurodevelopment and cognition.....	49
1.6.4. Neonatal catch-up growth and cognitive outcomes.....	51

1.7. Programming the brain: common outcomes and gaps in knowledge from animal studies of IUGR.....	53
1.7.1. Abstract.....	53
1.7.2. Introduction .....	54
1.7.3. Timing of neurodevelopment in animal models of experimental IUGR.....	57
1.7.4. Methods and timing of experimental IUGR in animal models .....	59
1.7.5. Neurodevelopmental and cognitive consequences of experimental IUGR .....	76
1.7.6. Gaps in knowledge and future directions .....	79
1.7.7. Conclusions and recommendations .....	84
1.8. Conclusions, thesis aims and hypotheses .....	86
Chapter 2 – General methods.....	88
2.1. Preamble.....	88
2.1. Cohort generation.....	89
2.1.1. Ethics Statement .....	89
2.1.2. Animals.....	89
2.1.3. Experimental groups.....	90
2.2. Behavioural testing.....	91
2.2.1. Habituation to experimenters.....	91
2.2.2. Apparatus.....	94
2.2.3. Behavioural test battery .....	96
2.2.4. Brain morphological analyses .....	100
Chapter 3 – Do I turn left or right? Effects of sex, age, experience and exit route on maze test performance in sheep .....	102
3.1. Preamble.....	102
3.2. Statement of Authorship .....	103
3.3. Abstract .....	106
3.4. Introduction .....	107
3.5. Methods.....	109

3.5.1. Ethics Statement .....	109
3.5.2. Animals.....	109
3.5.3. Learning Evaluation .....	110
3.5.4 Statistical analysis.....	112
3.6. Results .....	115
3.6.1. Between task differences .....	115
3.6.2. Outcomes in learning task (Task L) .....	116
3.6.3. Outcomes in first memory task (Task M1).....	119
3.6.4. Outcomes in first reversal task (Task R1) .....	120
3.6.5. Outcomes in second memory task (Task M2) .....	122
3.3.6. Outcomes in second reversal task (Task R2).....	126

## **Abstract**

Intrauterine growth restriction (IUGR) and poor perinatal growth in humans are associated with poorer cognition and memory and altered functional lateralisation. Altered brain morphology and neurodevelopment following IUGR appears responsible, and may be ameliorated by neonatal catch-up growth, however assessing relative effects of prenatal and postnatal growth on cognition in humans is difficult due to environmental confounders. Experimental placental restriction (PR) in sheep, via surgical removal of uterine epithelial attachment sites prior to mating, restricts intrauterine growth and is followed by catch-up growth. Cognitive consequences have not been examined in this model. Effects of sex, age and prior learning on cognition were therefore characterised in control (CON) sheep, then effects of PR on learning, memory, cognition, functional and morphological lateralisation were investigated.

Size at birth and neonatal fractional growth rates during the first 16 days of life (ie. neonatal catch-up growth) were measured for CON and PR offspring. Behavioural testing occurred at 18 and 40 weeks old. In maze tasks, trials and time per task, bleats and arm entries were recorded for initial learning (L), memory (M1, M2) and reversal (R1, R2) tasks. Behavioural lateralisation was recorded using obstacle avoidance and maze exit preference tasks, and structural lateralisation were measured in the prefrontal cortex brain region at 52 weeks of age.

In CON sheep, naive sheep aged 18 or 40 weeks required longer to complete task R1 than 40 week olds retested after learning the task at 18 weeks old, indicating prior learning was recalled at later ages. The exit route used for earlier learning tasks also predicted speed required to solve task R1 in 40N females.

Body weight and skull size at birth did not differ between CON and PR lambs utilised for behavioural testing. At 18 weeks, placentally restricted male lambs took more trials to solve the initial learning task, but required less time to complete task R1 than control males. Trials and time required to solve task M1 in 40 week old males correlated negatively with neonatal growth. Bleat frequency during task R1 in 18 week old females correlated positively with birth weight and neonatal fractional growth rate.

In 40 week old females, PR were more strongly lateralised in the maze exit preference task lateralisation than CON. Lateralisation direction was consistent between ages in PR females only, and was more consistent between tasks at 18 weeks in PR than CON females.

Behavioural lateralisation did not correlate with perinatal growth, and brain morphology at 52 weeks did not differ between treatments. Correlations between perinatal growth and adult brain morphology were largely limited to males, whereas correlations between behaviour and brain morphology existed largely in females.

In conclusion, effects of age, sex and experience on cognitive and behavioural outcomes must be taken into account when evaluating these outcomes in sheep. Effects of PR on cognition and behavioural lateralisation were limited but suggested sex-specific programming of postnatal neurodevelopment. Neonatal growth rate correlated with memory performance in males, suggesting interventions during this period may improve outcomes.

## **Statement of Originality**

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint award of this degree.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968. The author acknowledges that copyright of published works contained within this thesis resides with the copyright holder(s) of those works.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

## **Acknowledgements**

Thank you to my supervisors for their alternating patience and exasperated herding at necessary intervals, which helped me be a lot more productive than I would have been otherwise. While it was difficult staying in touch with everyone (five supervisors over three campuses!) somehow we got through it, and hopefully I have produced something that was worth it. Thank you to Kathy especially, who assisted with every step of experimentation and writing throughout the entire project.

Thank you to Helen Rimington, sheep technician extraordinaire, for her expert sheep care and husbandry during this project. I am extremely grateful to everyone who assisted with behavioural testing, without which it would have been literally impossible, but in particular Hong Liu, Amy Wooldridge and Danila Marini.

Thank you to my family, who have offered support along the whole journey, and to my fantastic girlfriend Katie for moral support, and encouraging photos of sheep when it was most needed. And hey, a special shout-out also to Coby Romano for bringing me ice cream at 3 am one night in the final week, when it was vitally necessary in order for continuing thesis progress.

## **Abbreviation list**

18N – 18 week-old sheep naive to cognitive and behavioural tests  
40E – 40 week olds retested after learning the task at 18 weeks old  
40N - 40 week-old sheep naive to cognitive and behavioural tests  
AGA – born at a birth weight appropriate for gestational age  
ACTH – adrenocorticotrophic hormone  
APIB - Assessment of Preterm Infant Behaviour  
BSID - Bayley Scale of Infant Development  
BW – birth weight  
CA1-4 – cornu ammonis fields 1-4  
CC - corpus callosum  
CON – controls  
CX – carunclectomy model  
DG – dentate gyrus  
DTI – diffusion tensor imaging  
EQ – energy quotient (energy intake/kg body weight per day)  
FA – functional anisotropy  
FGR – fractional growth rate  
fMRI – functional magnetic resonance imaging  
GA – gestational age  
GW – gestational week  
HPA – hypothalamic-pituitary-adrenal axis  
IQ – intelligence quotient  
IUGR – intrauterine growth restriction  
LBW – low birth weight  
MRI – magnetic resonance imaging  
NBAS - Neonatal Behavioural Assessment Scale  
PR – placentally restricted  
PVH - paraventricular hypothalamic nucleus

SES – socioeconomic status

SGA – born at a birth weight small for gestational age

Task L – initial learning task

Task M1 – first memory task

Task R1 – first reversal task

Task M2 – second memory task

Task R2 – second reversal task

THROM - thromboxane A<sub>2</sub> analogue (STA<sub>2</sub>) administration

UN – maternal gestational undernutrition

UPE - uteroplacental vessel bed embolisation

UPL - uteroplacental vessel ligation

VMH - ventromedial hypothalamic nucleus
