Abstract

Accumulation of DNA damage during infancy may increase risk of accelerated ageing and degenerative diseases such as cancers. Pregnancy is understood to be a state of high expression of inflammatory genes. It may be possible that infants, born to women at high risk of pre-eclampsia (PE): a condition associated with increased oxidative stress, inflammation and altered gene expression, may have increased DNA damage compared with infants born to women at low risk of developing PE. However, currently there are no baseline DNA damage data for infants born to mothers in relation to their low/high risk of developing PE in Australia.

This PhD project had four phases:

***A systematic literature search** was conducted with the aim to explore the literature and identify knowledge gaps in the role of folate in the etiology and prevention of PE. The review found (i) deficiency of folate and other B vitamins, with higher concentrations of oxidative stress biomarkers in maternal tissues and body fluids of women with PE when compared with women at low risk of PE, and (ii) some of this dysregulation may be balanced epigenetically with oral intake of methyl donors including folate and vitamins B₂.

***A prospective cohort study** was conducted; 'Diet and DNA damage in Infants' (The DADHI study), with the aim to study:

- (i) DNA damage, cytostasis, and cytotoxicity utilizing a comprehensive Cytokinesis block micronucleus cytome (CBMN-Cyt) assay in lymphocyte of Australian born infants [at birth (cord blood, n=82), 3 (n=64) and 6 months (n=53) (heel prick blood)] of mothers at low risk of PE
- (ii) association of maternal factors and infant birth outcomes with CBMN-Cyt biomarkers

(iii) whether mode of feeding influences CBMN-Cyt biomarkers in infants at 3 and 6 months after birth

This study found significant positive associations of infant birth outcomes (gestation age, birth weight, head circumference, birth length and APGAR score) and maternal anthropometric variables with CBMN-Cyt biomarkers, suggesting possible genotoxic effects on infant's DNA by metabolic processes that promote excessive growth and higher body mass index.

* The next aim was to determine

- (i) association of **blood micronutrient status** with CBMN-Cyt biomarkers in cord blood at birth and infant's blood at 3 and 6 months
- (ii) whether mode of feeding influences blood micronutrient status at 3 and 6 months after birth

The study observed significant associations of DNA damage biomarkers with infant birth outcomes and micronutrient status suggesting that both under and oversufficiency of some nutrients may be detrimental for cell growth and repair.

*A **pilot project** [in 'Investigations in the Folic acid clinical trial' (INFACT study)] with the aim to collect DNA damage data in the cord blood collected from infants of women at increased risk of developing PE. The study found that (i) maternal anthropometric variables may influence infant birth outcomes, mainly birth size, and (ii) INFACT cases (n=10) had higher frequency of CBMN-Cyt biomarkers compared with gender and birth weight matched DADHI controls (n=15).

These preliminary data could be used to form the design of larger studies required to confirm the association of maternal factors and PE with DNA damage in the infants at birth and later in life in the first 1000 days.

Acknowledgement

I express my gratitude to Prof Michael Fenech for allowing me to a life empowering opportunity through this project. Your continuous positive vibrancy, extraordinary knowledge, philosophical reflections and solid support during the challenging learnings of laboratory work, writing thesis as well through experiences of life has inspired me at every stage of this unique project. I feel privileged to have worked under your guidance and vision and sincere thanks for this opportunity.

I thank you Prof Bill Hague for allowing me to be a part of your family, continuous encouragement in staying focussed, cheering me up during the 'low phases'. I am grateful for your time, energy and intellectual inputs in completion of this project.

I sincerely thank you Dr Phil Thomas for always motivating me towards the right directions with your positivity, smiles, strengths, practical guidance and invaluable support for successful completion of this project. I also thank Prof Julie for her support and guidance despite her enormously busy schedule. I am truly blessed to have learned from the best supervisors and for being under their patronage while completing this milestone.

I express my sincere thanks to Suzette coat for being my mentor, guide and support. You always had time and patience for me while I admired and tried to imbibe your perseverance towards perfection.

A big thanks to everyone in the nutrigenomic laboratory especially Maryam Hor for training me in CBMN-Cyt assay twice!!!, calming my anxiety during the entire process, sharing your expertise, laughter, chocolates and tea and replying to my texts even late at nights. I also thank you Theodora Almond and Tina McCarthy for your invaluable support. I also sincerely thanks Bruce May for his support in attaining 'order' in my 'chaotic' time of optimising folate assay.

My special thanks to A/Prof Jayashree Arcot at the University of New South Wales and Dr Karrie Kam for training me in Microbiological assay of folate and continuing the support till I accomplished the enormous task by providing means as well as resources. I am also grateful to Prof Chandrika Piyathilake at the University Alabama, Birmingham and Dr Suguna Badiga for giving me all the necessary support even being thousands of miles away via skype irrespective of time and your own busy schedule.

And Himanshu for being my backbone through the entire journey, for your believe in me, and love and compassionate support during some of the most challenging time of our married life. I also thank my son for understanding and bringing joys at the most distressing times, and my mother in law for her unconditional support and wisdoms. I am sincerely thankful to our friends Sanjay, Swati, Vijaya for being the pillar of support and Saulai for her warmth and generous support!!

And last but above all, my Father who has been the inspiration, initiator and motivating luminous for my dreams and aspirations and mom for her endearing and blessings.

MTHFD1: methylenetetrahydrofolate dehydrogenase
MTHFR: methylenetetrahydrofolate reductase
MTRR: methionine synthase reductase
MTR: methionine synthase
MN: Micronuclei
MNC: Mononucleated lymphocyte cells
MMA: Methylmalonic acid
MDA: malondialdehyde
MS: Microsoft

MA: Microbiological assay
MRL: method reporting limits
MMP: matrix metalloproteinase
MS-SNuPE: methylation-sensitive single-nucleotide primer extension

NHANES: National Health and Nutrition Examination Survey
NHMRC: National Health and Medical Research Council's levels of evidence
NPB: Nucleoplasmic bridges
NBUD: Nuclear buds
NDI: Nuclear division index
NTD: Neural tube defects
NSW: New South Wales

OR: Odd ratio
OCM: One carbon metabolism
OSI: oxidative stress index

PE: Pre-eclampsia
PCR: Polymerase chain reaction
p: significance value
PHA: Phytohemagglutinin
PABA: Para amino benzoic acid
PBL: Peripheral blood lymphocyte
PTPE: preterm pre-eclampsia

RCT: randomized controlled trial
RBC: Red blood cells
RCF: red cell folate
r: correlation coefficient
RR: relative risk
RNA: Ribonucleic acid
ref-1: redox factor
RT-PCR, reverse transcription polymerase chain reaction

SD: standard deviation
SEM: standard error of mean
SAM: S-adenosylmethionine
SAH: S-adenosyl homocysteine
SGA: Small for gestation age
SSE: sister chromatid exchange
THF: tetra hydro folate
TNF: Tumor necrosis factor
TLR-9: toll like receptor-9
TS: thymidylate synthase
TAS: total antioxidant status
TOS: and total oxidant status
WCH: Women's and Children Hospital

Publications arising from this thesis

1. Singh MD, Thomas P, Owens J, Hague W, Fenech M, 2005. 'Potential role of folate in Pre-eclampsia', Nutrition Reviews .Oct; 73 (10):694-722. Impact factor 6
2. Singh MD, Thomas P, Hor M, Almond T, Owens J, Hague W, Fenech M 2016. 'Infant birth outcomes are associated with DNA damage biomarkers as measured by CBMN-Cyt assay-The DADHI study'. Submitted with major revisions to Mutagenesis journal

Presentations arising from this thesis

1. 'Genome stability of infants as measured by CBMN-Cyt assay and influence of feeding during six months after birth' at Nutrition society of Australia-Adelaide Student presentation event, 19 November 2015
2. 8th Congress of the International Society of Nutrigenetics/Nutrigenomics 2-3 May 2014, Gold Coast, Australia
3. Florey postgraduate Research Conference, 24th September, 2015
4. Joint Annual Scientific Meeting of the Nutrition Society of NZ and the Nutrition Society of Australia, 1st - 4th December 2015
5. 'Genome stability in lymphocytes of South Australian babies as measured by Cytokinesis Block Micronucleus assay', Oral presentation as part of Annual review at joint HDR seminar programme for the Disciplines of Obstetrics and Gynaecology and Robinson Institute, 12th March 2015
6. 'Folate and Genome Integrity in Infants', Oral presentation as part of Annual review at joint HDR seminar programme for the Disciplines of Obstetrics and Gynaecology and Robinson Institute, 10th June 2014
7. 'Diet and DNA Health in Infant', Oral presentation at CSIRO Nutrigenomic Laboratory, June 2014
