<u>Summary</u>	(vii)
<u>Abbreviations</u>	(x)
<u>CHAPTER I</u> INTRODUCTION	
1.1 <u>General Introduction</u>	2
1.1.1 Definition of Intrauterine Growth Retardation	2
1.1.2 Clinical Identification of Intrauterine Growth Retarded Infants	5
1.1.3 Complications of Intrauterine Growth Retardation	5
1.1.4 Categories of Intrauterine Growth Retarded Infants	8
1.1.5 Foetal Growth	10
1.1.6 Causes of Intrauterine Growth Retardation	10
1.1.7 Neurological Abnormalities and the Long Term Prognosis for Intrauterine Growth Retarded Infants	14
1.1.8 Purpose of Study	16
1.1.9 Aims	16
<u>CHAPTER II</u> WATER TURNOVER RATES	
2.1 <u>Introduction</u>	19
2.1.1 History	19
2.1.2 Measurement of Water Turnover	20
2.1.3 Behaviour of D ₂ O in the Body	21
2.1.4 Toxicity of D ₂ O	21
2.1.5 Reliability of the Measurement of D ₂ O	24
2.1.6 Techniques for the Measurement of D ₂ O	24

CONTENTS cont'd.

<u>CHAPTER II</u>	cont'd.	<u>Page</u>
2.2	<u>Methods</u>	26
2.2.1	Patients and Data Collection	26
2.2.2	Classification of Infants	28
2.2.3	Perinatal Risk Score	29
2.2.4	Skinfold Thickness Measurements	29
2.2.5	Deuterium Oxide Administration	30
2.2.6	Urine Collections	30
2.2.7	Extraction and Purification of Neonatal Urine	31
2.2.8	Deuterium Oxide Assay Procedure	33
2.2.9	Determination of D ₂ O Concentration	34
2.2.10	Calculation of Deuterium Oxide Clearance	37
2.2.11	Data Analysis	39
2.2.12	Follow-up Study of Infants	39
2.3	<u>Results</u>	41
2.3.1	Optimal Sample Number	41
2.3.2	Water Turnover Rates	43
2.3.3	Gestational Influence	45
2.3.4	Clinical Correlations	48
2.3.5	Antenatal Investigations	50
2.3.6	Multiple Births	52
2.3.7	The 10th Percentile Weight for Gestation	52
2.3.8	Follow-up Studies	53
2.4	<u>Discussion</u>	54
<u>CHAPTER III</u>	SKELETAL MUSCLE PROTEIN BREAKDOWN IN EARLY HUMAN DEVELOPMENT	60
3.1	<u>Introduction</u>	61

CONTENTS cont'd.

<u>CHAPTER III</u>	cont'd.	<u>Page</u>
	3.1.1 Measurement of Muscle Protein Breakdown	61
	3.1.2 3-Methylhistidine (Background)	62
	3.1.3 Creatinine in Urine and Amniotic Fluid	63
	3.1.4 3-Methylhistidine to Creatinine Ratios in Health and Disease	63
	3.1.5 Aims	64
	3.2 <u>Methods</u>	66
	3.2.1 Subjects	66
	3.2.2 Diet and 3-Methylhistidine	66
	3.2.3 Sample Collections	66
	3.2.4 Creatinine Determination	67
	3.2.5 3-Methylhistidine Determination	67
	3.2.6 Calculation of Muscle Protein Breakdown Rates	69
	3.3 <u>Results</u>	70
	3.3.1 Neonatal Urine Samples	70
	3.3.2 Amniotic Fluid Samples	76
	3.4 <u>Discussion</u>	84
<u>CHAPTER IV</u>	CONCLUSION	88
<u>APPENDICES</u>		
	Appendix 1 Antenatal Details Sheet	93
	Appendix 2 Postnatal Details Sheet	95
	Appendix 3 Perinatal Risk Score for Growth Retardation	96
	Appendix 4 Rate Constant Results	97
	Appendix 5 Flow Diagram of Automated Method for the Determination of Creatinine	98

APPENDICES cont'd.

PREFACE

To the best of the author's knowledge, this thesis contains no material previously published or written by another person, except where due reference is made in the text. It contains no material which has been submitted or accepted for the award of any other degree or diploma in any University.

(A. Hocking)

ACKNOWLEDGEMENTS

This thesis was undertaken with the supervision of Dr's. A.H. MacLennan and D. Frewin, at the Department of Obstetrics and Gynaecology, The Queen Victoria Hospital. The helpful advice of Dr. MacLennan and Dr. Frewin was greatly appreciated.

The assistance of Dr. R. Haslam, Dr. F.J. Ballard, Dr. Eu, Dr. R.F. Seamark, G. Millington, Dr. Pearce, Professor D.B. Cheek, A. Fitzgerald, R. Green, R.L. Burgoyne, B. Godfrey, D. Colley and the Records Office Staff were invaluable.

Special thanks are extended to the Nursing and Professional Staff at The Queen Victoria Hospital, and to the parents of all the infants participating in the study without whose assistance this work could not have been undertaken.

Many thanks goes to Miss C. Sandercock for the typing of this thesis.

The project was supported by the National Health and Medical Research Council of Australia.

Especially, I would like to thank my parents for encouraging and supporting me throughout my academic studies, and my husband for his invaluable help.

SUMMARY

This thesis describes two new indices of perinatal morbidity relating to intrauterine growth retardation, namely neonatal water metabolism and protein metabolism.

Water metabolism was studied by determining body water turnover rates of 106 newborn infants, using the non-radioactive isotope of water, deuterium oxide (D_2O). The rate at which D_2O is excreted from the body can be expressed as a rate constant of water turnover. Water turnover rates of the infants were correlated with independent obstetric and paediatric assessments of the newborn infants. The neonates were classified by strict clinical criteria into three main groups, fully grown ("normal"), borderline (exhibiting some features of growth retardation) and clearly intrauterine growth retarded. There were highly significant differences between the water turnover rates of each of these groups, the medians of the rate constants ($\times 10^4$) being 73.3, 85.9 and 100.2 (h^{-1}) respectively. This test is also quantitative, in that infants who were more clinically growth retarded displayed higher water turnover rates.

Body water turnover rates are simple to perform by this method of isotope dilution and the collection of neonatal urine samples is convenient, using a paper towel placed inside the infant's nappy. However, 4-8 urine samples are necessary for this test to be performed.

A test requiring only a single urine sample would be ideal and, for this reason, the measurement of 3-methylhistidine was considered. Urinary excretion of 3-methylhistidine has been shown to be an index of myofibrillar protein breakdown and 3-methylhistidine/creatinine ratios give a measure of protein turnover. Measurement of this amino acid has never before been undertaken in relation to intrauterine growth retardation in neonatal urine or amniotic fluid samples.

3-methylhistidine/creatinine ratios have been measured in amniotic fluid of fetuses ranging from 16-21 weeks and 27-42 weeks gestation. The ratio is high in amniotic fluid in early gestation (approximately 60 nmol/ μ mol),

decreasing at term to a level of approximately 10 nmol/ μ mol. The first neonatal urine ratio correlates well with the corresponding term amniotic fluid ratio. A rapid rise in the 3-methylhistidine/creatinine ratio occurs postnatally, reaching a plateau at around two days.

In a sample of eight normal and seven intrauterine growth retarded infants, the ratio in the first neonatal urine sample was consistently lower in the normal than in the growth retarded group. There is a possibility that the 3-methylhistidine/creatinine ratio may be used as an indicator of growth retardation.

The measurement of water turnover rates is a simple quantitative test for growth retardation and, although it is not certain whether 3-methylhistidine/creatinine ratios yield a quantitative result, it may potentially be used antenatally, as well as neonatally. Both tests are advantageous, in that they are independent of the gestational age of the infant, birth weight, behaviour and appearance.

ABBREVIATIONS

Abbreviations used in the text are as follows;

IUGR = intrauterine growth retardation

ln = natural logarithm

3MH = 3-methylhistidine

Cr = creatinine

D₂O = deuterium oxide

ppm = parts per million
