To my mother, Alfiya Galiaskarova, for her endless love, faith and support

Посвящается моей маме, Галиаскаровой Альфии Агзамовне, за ее  
бесконечную любовь, веру и поддержку

# Acknowledgments

---

A PhD journey is not a lonely endeavour. To reach this point I contacted, collaborated and worked with many people who contributed to the success that I perceive as our common goal.

I am grateful to Professor Vernon Ireland, my principal supervisor, who opened the door to my new life and experience and invited me on a journey into complexity science. I appreciate the support and freedom to study, think and work. His positive attitude always recharged me with optimism.

My special gratitude goes to Dr Barry Elsey, my second supervisor, for being *guide, philosopher* and *friend* during the last five years of my life. Through him I have had a lasting experience of adult learning in practice rather than in words. His encouragement and faith helped me grow professionally and believe in myself. His friendship helped me to remember my family and supported me during my pregnancy and the first year of motherhood, gradually transforming me into a mother meanwhile doing my research.

I am glad to have had an opportunity to work with Dr Matthew Richmond who led the research from the DST Group side. His enormous effort guided me through the Australian Defence system and made things possible and partially funded by the DST Group. His knowledge, support and humour made our collaboration enjoyable and productive.

I am thankful to Dr Anne-Marie Grisogono who developed the Conceptual Framework for Adaptation that attracted my attention. This was an intellectually stimulating piece of work that laid the foundation for the whole thesis.

A special gratitude is owed to the DST Group and the Australian Army – it was a true surprise for me to see how open and responsive a semi-closed

organisation can be. I should acknowledge the Australian culture that plays an important part in that openness. I am thankful for the greatest opportunity to meet every interviewee and hope that my understanding of the Australian Army will contribute to its further success.

I also thank Charles Clennell for his deep knowledge of the English language that has helped me to improve my expression in English.

Sometimes work of non-academic people is not obviously seen. But they play no less a role in our success. I am happy to be surrounded by my family friends who have been supporting my journey. I am very thankful to Mrs Kelly Abbas, Dr Elsey's wife, for her patience and love in organising wonderful dinners for us as students and as a family. Without her our collaboration and success would not be possible. My gratitude to all my friends for being proud of me doing this PhD and enabling me to finish.

My endless love and gratitude goes to my family. To my mum who provided the greatest example of love and professional success, who has loved and believed in me all my life and to whom I am obliged for all my achievements. To my husband Nikita my love and thanks for his patience in listening to my ideas and thoughts and his on-going encouragement. His continuing love allows me to find my way in life; his constant desire to move forward keeps me moving forward; his ability to think abstractly helped to advance my ideas. My love, kisses and hugs to my little daughter Sofia who behaved well in my belly during all interviews and contributed to my writing through being a team member of our family. Through her I understood that adaptation is not a pleasant thing, but we are forced to succeed for those we love.

# Abstract

---

Modern military engagements are characterised by complexity, dynamics and unpredictability that force armies as complex social bureaucratic systems to adapt to continuously changing conditions of war. This is an on-going vital matter since modern society has been under stress from recent military engagements in Afghanistan, Iraq, Syria as well as current terrorist attacks in France and Belgium. We are seeking a way to describe and understand from a theoretical perspective both the operational conditions and the process of adaptation that the Australian Army needs to employ in response to external changes of these extreme kinds. In this regard Complex Adaptive System (CAS) theory offers an advanced method of understanding contemporary warfare and military organisations that will represent the core focus of the thesis; its main goal being to appraise organisational change in the Australian Army through the lens of CAS theory.

The literature review on this topic identifies changes in contemporary warfare and characterises both modern military engagements and organisations as complex adaptive systems. Any army representing the defence of a nation state strives to be both capable and effective in its military engagements, most notably in conditions of war or hostilities against a known enemy combatant. The objectives of capability and effectiveness, often understood as *'fit for purpose'*, means that an army must always be in a state of readiness to change, not only to keep abreast of the methods and tools of warfare technology that continuously evolve but ideally to be strategically ahead of the enemy, whether in a classical battleground scenario or, as seems more likely, fighting an opponent who has the advantage of local knowledge, an element of surprise and other features of asymmetrical warfare providing them with the upper hand. Contemporary warfare, as

described in the history books, has already moved beyond our capacity to understand and interpret the nature of conflict. Moreover, the lessons of military engagement for the Australian Army in recent years fighting insurgency in faraway lands point to a new level of complexity where unforeseen and unknown factors play a decisive part in determining success and failure in strategic planning and actual operations. Difficult though it may be, the Army has no choice but to embrace new 'out of the box' thinking and get to grips with the mysteries of CAS in order to adapt and remain effective. This leads us to the main research question that is:

*How does a modern professional army adapt, structurally and functionally, to the changing nature of military engagement, which is increasingly characterised by complexities arising outside of conventional operations?*

CAS theory can be seen as a promising perspective in appraising these complexities as it provides a number of characteristics that offer a better understanding of the nature of modern warfare and military organisations. To apply CAS theory to a real-life case of organisational change we have chosen the Conceptual Framework for Adaptation (CFA) since it provides a good descriptive model of CAS. Moreover, CFA, currently being developed by the Defence Science and Technology Group (DST Group) in Australia, is the most familiar framework for the Australian Army in the task of reviewing the complexities of both modern warfare and military organisations. For this reason, the thesis uses CFA as a methodological basis for appraising a case of organisational change. The findings will draw on ideas taken from CAS theory and CFA as a means to appraise organisational change.

From a practical point of view, we have selected a recent case of organisational change that had been introduced into the Australian Army. In particular, in response to future environment complexities, the Australian

Army has released *Adaptive Campaigning* and launched the Adaptive Army Initiative (AAI). This is an ambitious program that puts the whole organisation on an adaptive footing, claiming to be a restructuring of higher command and control arrangements by providing a systemic approach to adaptation across the entire Army. The review of the AAI aims to explore from a theoretical perspective, how the Army as a complex organisation, and given its multiple functions, levels of command and control, can actively manage this adaptation to a continuously changing environment. During the AAI review we conducted 19 face-to-face interviews that included 13 senior Officers, 3 mid-ranking Army Officers and 3 external to the Army people. We also recognise that organisational learning plays a crucial role in the way the Army adapts to external requirements. To cover this ground we conducted a review of the lessons mechanisms, Army Lessons Network (ALN); the focus being on the operational aspects (process, structures and roles) that make an organisation adaptable to changing conditions. Thus, the thesis describes how the change was designed and implemented as well as the outcomes that have been possible to track so far. Appraisal of the lessons processes in the Army, through the ALN review, helps us to understand the role of organisational learning as a mechanism of change. Both the AAI and ALN analyses demonstrate that the Army has developed characteristics of CAS.

Taking into account the views of experienced senior Army Officers about their own self-generated initiative to drive and foster an adaptive, change-oriented culture, the thesis demonstrates the depth of understanding of the challenge of achieving *'fit for purpose'* organisational performance as well as the important contribution of leadership, a supportive socio-culture and the lubrication of organisational learning. This is what the thesis has revealed and its special knowledge contribution is to obtain the insights from Army

leaders as practitioners about what is going on in a modern army in a continuous process of transition. Indeed, gaining access to the thoughts of these truly professional soldiers has provided the thesis with unique and original insights into military operations.

The thesis explores the development of a model of the Army as a complex adaptive system. It acknowledges that in the context of the practical orientation of the Army theory-building this is just the beginning of a long road-testing process. A serious attempt has been made to start the theory-to-practice process with an extensive exploration of leading ideas inspired and drawn from complex system thinking.

**Key words:** complex adaptive systems (CAS), organisational change, organisational learning, organisational adaptation, Australian Army, Conceptual Framework for Adaptation (CFA), irregular warfare
