GLOSSARY	x
CHAPTER 1 INTRODUCTION	1
1.1 Study Aims and Objectives	5
CHAPTER 2 LITERATURE REVIEW: OBESITY, PHYSICAL ACTIVITY AND PLANNING AND TRANSPORT RESEARCH.....	8
2.1 Overweight and Obesity	9
2.1.1 US Obesity	11
2.1.2 Australian Obesity	15
2.2 Direct Medical Costs of Obesity.....	20
2.3 Physical Activity	23
2.3.1 Environmental Influences of Physical Activity.....	24
2.4 The Built Environment and the Influence on Physical Activity: Evidence from Transport and Planning Studies.	31
2.5 Factors Identified from the Literature	65
CHAPTER 3 METHODOLOGY: USING AUSTRALIAN DATA TO DERIVE A WALKABILITY INDEX.....	69
3.1 Study Area.....	70
3.2 Spatial Units	72
3.3 Spatial Datasets	75

3.3.1	Spatial Building Blocks	75
3.3.2	Proximity Data	76
3.3.3	Connectivity Data	79
3.4	Walk Index Measures	79
3.4.1	Spatial Building Blocks	80
3.4.2	Dwelling Density	83
3.4.3	Land Use Mix	87
3.4.4	Retail Opportunity	90
3.4.5	Road Length and Intersection Density	91
3.5	Creating the Walkability Index	97
3.6	Survey	97
CHAPTER 4	RESULTS	100
4.1	Measures of Connectivity	100
4.1.1	Measures of Connectivity: Intersection	101
4.2	Measures of Proximity	123
4.2.1	Measures of Proximity: Dwelling density	123
4.2.2	Measures of Proximity: Land Use	128
4.2.3	Measures of Proximity: Retail	131
4.3	Validating the Walkability Index	134
CHAPTER 5	DISCUSSION: ISSUES, FUTURE DEVELOPMENTS AND APPLICATIONS OF WALKABILITY-RELATED MEASURES	138
CHAPTER 6	CONCLUSION	148
	REFERENCE LIST	151
	APPENDIX 1: AVENUE CODE FOR EXTRACTING SPATIAL DATA	160
	APPENDIX 2: LAND USE CLASSIFICATION	164

ABSTRACT

Obesity is reported to be an epidemic (Cameron et al. 2003; Contaldo and Pasanisi 2003), particularly in western countries with 31% of adults aged over 20 years in the US either overweight or obese in 1999-2000 (CDC 2004). A similar situation is reported in Australia with 16.7% of the adult population (aged 18 or older) obese in 2001 and 34.4% overweight (Australian Institute of Health and Welfare 2003). The US Surgeon General (1996) highlighted the link between increasing girth and decreasing activity levels and suggested that moderate intensity activity such as frequent walking could improve the health outcomes for overweight and obese people. Current public health recommendations emphasize the benefits of accumulating 30 minutes of moderate intensity physical activity, such as walking, daily (Sallis et al. 2004).

As walking for health reasons is important, factors that influence people to walk, in particular environmental influences, are the subject of a considerable research effort. A wide range of factors have been associated with walking behaviour by the public health professionals and transport and town planners, due to the recognition that neighbourhood design and land use may affect transport choice, such as automobile, public transit or walking/cycling (Saelens, Sallis and Frank 2003). A range of characteristics that are correlated with higher rates of walking review have been identified from the literature and grouped as the 3Ds (Cervero and Kockelman 1997) or proximity and connectivity (Sallis et al. 2004; Saelens, Sallis & Frank. 2003; Frank and Engelke 2001). Consistently, population density, land use mix, the

street network and retail access are linked with definitions of neighbourhoods as either supporting walking behaviour or automobile dominated.

This aim of this project is to build an objective walkability index based upon the physical environmental factors identified from the research and apply this to Adelaide, a large urban city in Australia using geographic information systems (GIS). Specifically, this study will build upon the work from the US (Frank et al. 2005) in delimiting cities into walk friendly or unfriendly, adapted to Australian data to provide the basis for an index that can be applied to Australian cities to highlight the variations across cities and between cities.

DECLARATION

This work contains no material which has been accepted for the award of any other degree or diploma in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text.

I give my consent to this copy of my thesis, when deposited in the University Library, being available for loan and photocopying.

ACKNOWLEDGMENTS

This thesis has been completed over a number of years with a variety of people assisting along the way. In the initial period, Dr Martin Bell offered good counsel and advice about the higher degree system and although Martin moved back to Queensland, his earlier contribution is appreciated. Professor Graeme Hugo has been of invaluable assistance throughout the process and moved me back on track at the right time with a quality topic to get the thesis completed. Thanks also to the people in the PLACE project who offered a different perspective to some of the issues concerning health and physical activity to augment the geographer's view of the world, in particular, Dr Evie Leslie, Professor Neville Owens and Dr Lawrence Franks.

I owe a huge debt to my family, my wife Jane and my sons Gareth and Owen, as they were most often around when the frayed temper snapped due to late nights and lack of sleep. My wife contributed greatly to the finished thesis with encouragement along the way, support all the time and assistance with proof reading and final production.

GLOSSARY

ABS	Australian Bureau of Statistics
AIHW	Australian Institute of Health and Welfare
ASD	Adelaide Statistical Division
BMI	Body Mass Index
CCD	Census Collection District
DCDB	Digital cadastre data base
GIS	Geographic Information System
LOTS	Land ownership and tenure system
NHS	National Health Survey
PLACE	Physical Activity in Localities and Community Environments
Planning SA	South Australian Planning Department
SES	Socio economic status
TOD	Transit oriented development
VMT	Vehicle miles traveled
