

Management and Nutrition of the Replacement Gilt

A thesis submitted in total fulfillment of the requirements for the degree of
DOCTORATE of PHILOSOPHY

By

William van Wettere

B.Sc. (Honours)

in the

School of Agriculture Food and Wine

Discipline of Agricultural and Animal Science

The University of Adelaide, Australia

March 2008

CHAPTER 1 INTRODUCTION AND LITERATURE REVIEW	- 1 -
1.1 Preamble	- 2 -
1.2 Reproductive development in the gilt	- 4 -
1.2.1 <i>Pre-pubertal patterns of gonadotrophin and steroid release</i>	<i>- 4 -</i>
1.2.2 <i>Pre-pubertal development of the ovarian follicle pool</i>	<i>- 6 -</i>
1.2.3 <i>Ovarian feedback control of GnRH and gonadotrophin secretion.....</i>	<i>- 8 -</i>
1.2.4 <i>Maturation of ovarian feedback mechanisms</i>	<i>- 11 -</i>
1.2.4.1 <i>Development of ovarian feedback</i>	<i>- 12 -</i>
1.2.4.2 <i>Maturation of positive (stimulatory) feedback</i>	<i>- 13 -</i>
1.2.4.3 <i>Maturation of negative (inhibitory) feedback</i>	<i>- 14 -</i>
1.2.5 <i>Puberty attainment.....</i>	<i>- 16 -</i>
1.2.6 <i>Proposed sequence of endocrine and ovarian events leading to puberty</i>	<i>- 19 -</i>
1.3 Factors affecting puberty attainment.....	- 21 -
1.3.1 <i>Management cues: boar exposure</i>	<i>- 22 -</i>
1.3.1.1 <i>Boar component stimuli</i>	<i>- 22 -</i>
1.3.1.2 <i>Variation in the boar effect: boar stimulus value</i>	<i>- 27 -</i>
1.3.1.3 <i>Variation in the 'boar effect': Contact factors.....</i>	<i>- 28 -</i>
1.3.1.4 <i>Gilt response to boar contact</i>	<i>- 32 -</i>
1.3.2 <i>Environmental cues: seasonal and climatic effects.....</i>	<i>- 36 -</i>
1.3.3 <i>Developmental cues: gilt age</i>	<i>- 39 -</i>
1.3.4 <i>Developmental cues: weight, body composition and growth rate..</i>	<i>- 41 -</i>
1.3.5 <i>Developmental cues: nutrition and metabolic signals</i>	<i>- 44 -</i>
1.3.6 <i>Developmental cues: genetics and genotype</i>	<i>- 50 -</i>
1.4 Factors affecting first litter size.....	- 52 -
1.4.1 <i>Regulation of ovarian follicle growth and oocyte developmental competence.....</i>	<i>- 53 -</i>
1.4.1.1 <i>Growth and development of the antral follicle</i>	<i>- 54 -</i>
1.4.1.2 <i>Intra-ovarian control of follicle growth and development.....</i>	<i>- 56 -</i>
1.4.1.3 <i>Gonadotrophin control of follicle growth and ovarian steroidogenesis.....</i>	<i>- 57 -</i>
1.4.1.4 <i>Metabolic influences on follicle growth and development.....</i>	<i>- 60 -</i>
1.4.1.5 <i>Morphological aspects of oocyte development and maturation.....</i>	<i>- 62 -</i>

1.4.1.6	Intra-follicular steroids and oocyte developmental competence.....	- 65 -
1.4.2	<i>Follicle selection and ovulation</i>	- 68 -
1.4.3	<i>Embryo losses during gestation</i>	- 72 -
1.4.4	<i>Effects of dietary intake on litter size</i>	- 74 -
1.4.4.1	Pre-mating dietary intake and follicle growth.....	- 75 -
1.4.4.2	Dietary intake and ovulation rate.....	- 77 -
1.4.4.3	Post-mating feed intake and embryo survival.....	- 78 -
1.4.4.4	Pre-mating nutrition, oocyte quality and embryo survival.....	- 79 -
1.4.4.5	Dietary intake and ovarian activity.....	- 81 -
1.4.5	<i>Effects of age and oestrus at first mating on litter size</i>	- 85 -
1.5	Purpose and Scope of the Investigation	- 86 -
CHAPTER 2 INCREASING THE AGE OF GILTS AT FIRST BOAR CONTACT IMPROVES THE TIMING AND SYNCHRONY OF THE PUBERTAL RESPONSE BUT DOES NOT EFFECT POTENTIAL LITTER SIZE		- 88 -
2.1	Introduction	- 89 -
2.2	Methods	- 90 -
2.2.1	<i>Animals, housing and feeding</i>	- 91 -
2.2.2	<i>Boar contact and oestrous detection</i>	- 91 -
2.2.3	<i>Artificial Inseminations</i>	- 93 -
2.2.4	<i>Animal Measurements</i>	- 94 -
2.2.4.1	Gilt liveweight and backfat measurements.....	- 94 -
2.2.4.2	Reproductive parameters: ovulation rate and embryo measurements.....	- 94 -
2.2.4.3	Statistical Analysis.....	- 95 -
2.3	Results	- 95 -
2.3.1	<i>General Results</i>	- 95 -
2.3.2	<i>Puberty attainment</i>	- 96 -
2.3.3	<i>Potential litter size</i>	- 97 -
2.4	Discussion	- 101 -
CHAPTER 3 IMPACT OF PREPUBERTAL GROWTH RATE ON OVARIAN FOLLICLE POPULATIONS AND OOCYTE COMPETENCE OF 161- AND 175-DAY OLD, NON-CYCLING GILTS		- 105 -
3.1	Introduction	- 106 -
3.2	Materials and Methods	- 107 -
3.2.1	<i>Animals</i>	- 108 -
3.2.2	<i>Housing and Feeding</i>	- 109 -
3.2.3	<i>Animal measurements</i>	- 111 -

3.2.3.1	Gilt liveweight, backfat and maximum muscle depth measurements.....	- 111 -
3.2.3.2	Collection of blood samples.....	- 111 -
3.2.3.3	Collection of ovaries and follicle cells.....	- 111 -
3.2.3.4	Collection of uterine horns and liver.....	- 112 -
3.2.4	<i>Oocyte developmental competence</i>	- 113 -
3.2.4.1	Media and chemicals.....	- 113 -
3.2.4.2	In vitro maturation of oocytes.....	- 114 -
3.2.4.3	Parthenogenetic activation.....	- 115 -
3.2.4.4	Oocyte nuclear maturation.....	- 117 -
3.2.5	<i>Hormone assays</i>	- 117 -
3.2.5.1	Statistical analysis.....	- 118 -
3.3	Results	- 120 -
3.3.1	<i>Growth Characteristics</i>	- 120 -
3.3.2	<i>Plasma hormone concentrations</i>	- 122 -
3.3.3	<i>Reproductive characteristics</i>	- 123 -
3.3.3.1	Ovarian follicle populations of 161 day old gilts.....	- 124 -
3.3.3.2	Ovarian follicle populations of 175 day old gilts.....	- 125 -
3.3.3.3	Developmental competence of oocytes obtained from 161 day old gilts.....	- 128 -
3.3.3.4	Developmental competence of oocytes obtained from 175 day old gilts.....	- 130 -
3.3.3.5	Follicular fluid steroid concentrations: 161 day old gilts.....	- 132 -
3.3.3.6	Follicular fluid steroid concentrations: 175 day old gilts.....	- 134 -
3.4	Discussion	- 137 -
3.4.1	<i>Endocrinology</i>	- 138 -
3.4.2	<i>Ovarian folliculogenesis</i>	- 139 -
3.4.3	<i>Intra-follicular characteristics and oocyte developmental competence</i>	- 143 -
3.4.4	<i>Conclusion and Implications</i>	- 146 -
CHAPTER 4	EFFECT OF PRE-PUBERTAL GROWTH RATE ON GILT RESPONSE TO BOAR STIMULATION AND FECUNDITY	- 148 -
4.1	Introduction	- 149 -
4.2	Methods	- 152 -
4.2.1	<i>General methods: experiments three and four</i>	- 153 -
4.2.1.1	Animals and housing.....	- 153 -
4.2.1.2	Gilt liveweight, backfat and maximum muscle depth measurements.....	- 154 -
4.2.1.3	Gilt feeding.....	- 154 -
4.2.1.4	Collection of blood samples and hormone assays.....	- 155 -
4.2.2	<i>Boar contact and oestrus detection</i>	- 155 -
4.2.2.1	Boar exposure: Experiment Three.....	- 156 -

4.2.2.2	Boar exposure: Experiment Four.....	- 157 -
4.2.3	<i>Reproductive parameters: ovulation rate and embryo measurements....</i>	
	- 157 -
4.2.3.1	Reproductive parameters: Experiment Three.....	- 158 -
4.2.3.2	Reproductive parameters: Experiment Four	- 158 -
4.2.4	<i>Statistical analysis.....</i>	- 159 -
4.3	Results.....	- 160 -
4.3.1	<i>Experiment Three.....</i>	- 160 -
4.3.1.1	Gilt liveweight, growth rate, P2 backfat and MMD.....	- 160 -
4.3.1.2	Puberty attainment	- 161 -
4.3.1.3	Reproductive parameters	- 165 -
4.3.1.4	Plasma hormone concentrations	- 167 -
4.3.2	<i>Experiment Four.....</i>	- 168 -
4.3.2.1	Gilt liveweight, growth rate, P2 backfat and MMD.....	- 168 -
4.3.2.2	Puberty attainment	- 169 -
4.3.2.3	Reproductive parameters	- 174 -
4.3.3	<i>Plasma hormone concentrations.....</i>	- 177 -
4.4	Discussion	- 179 -
4.4.1	<i>Puberty attainment.....</i>	- 179 -
4.4.2	<i>Endocrinology.....</i>	- 187 -
4.4.3	<i>Potential litter size</i>	- 188 -
4.4.4	<i>Post-ovulatory progesterone profiles.....</i>	- 194 -
4.4.5	<i>Conclusion and Implications.....</i>	- 196 -
CHAPTER 5	GENERAL DISCUSSION AND CONCLUSION.....	- 197 -
5.1	Introduction	- 198 -
5.2	Puberty attainment and potential litter size: effects of age and oestrus number.....	- 198 -
5.3	Ovarian maturity, puberty attainment and potential litter size: relative effects of chronic versus acute dietary restriction.....	- 202 -
5.4	Conclusion.....	- 211 -
5.5	Future Research	- 212 -
5.6	Practical implications	- 213 -
CHAPTER 6	LITERATURE CITED	- 215 -
CHAPTER 7	APPENDIX.....	- 255 -

List of Figures

- Figure 1.2.1 Main components of the porcine hypothalamic-pituitary-ovarian axis (Adapted from Prunier and Quesnel, 2000) - 5 -
- Figure 1.2.2 Circulating gonadotrophin levels in gilts between between 15 and 192 days of age: A) Plasma concentrations (ng/ml) of LH (■) and FSH (x); B) frequency (▲) and amplitude (○) of LH pulsing (adapted from Camous et al., 1985)..... - 6 -
- Figure 1.2.3 Mean number of surface antral follicles present on the ovaries of gilts from birth to puberty. Closed triangles (▲) represent follicles with a diameter of 1 – 3 mm, crosses (x) represent follicles > 3mm in diameter (adapted from Dyck and Swierstra, 1983) - 8 -
- Figure 1.3.1 Schematic representations of mean plasma concentrations of oestradiol (pg/ml) and Luteinising Hormone (LH) (ng/ml) from 120 hours before to 24 hours after first observed oestrus in four, 180 day old, boar exposed gilts. Closed squares (■) represent oestradiol and closed triangles (▲) represent LH (adapted from Esbenshade et al., 1982)..... - 34 -
- Figure 1.3.2 Effect of gilt age at start of boar contact on the interval to puberty attainment, adapted from A) Kirkwood and Hughes (1979) and B) Burnett et al. (1988)..... - 40 -
- Figure 1.4.1 Timing of pre-natal mortality throughout pregnancy (mean \pm S.E.M) (adapted from A) van der Lende and Schoenmaker., 1990 and B) Lambert et al., 1991)..... - 54 -
- Figure 1.4.2 Summary of mammalian oocyte meiosis: (1 - 4) prophase stages of first meiotic division, which in most mammals occur during foetal life; (5) dictyate stage; (6) germinal vesicle stage (GV), meiotic process is arrested at this stage (first meiotic arrest); (7 - 11) resumption of meiosis and completion of first maturation division; (11) metaphase II (MII), this is the second meiotic arrest, in which state the oocyte is normally ovulated; (12 -

14) second meiotic division, which normally occurs in the oviduct, following sperm penetration (taken from Guraya, 2000).....	- 63 -
Figure 1.4.3 Proportion of surface antral follicles within three size categories (< 1.0 mm, 1.0 - 2.9 mm, 3 – 5 mm) at weaning of sows receiving either a high (■) or a low (■) lactation feed intake during lactation. ^{ab} Superscripts within follicle size categories indicate significant difference (adapted from Quesnel et al., 1998)	- 76 -
Figure 2.2.1 Supervised full contact with a vasectomized boar (A), and a gilt exhibiting a standing reflex (B)	- 92 -
Figure 2.3.1 Cumulative proportion of gilts attaining puberty in response to daily contact with a vasectomized boar when boar exposure commenced at either 161, 182 or 203 days of age. Closed squares (■) represent 161 days of age at start of boar contact, crosses (x) 182 days of age at start of boar contact, and open circles (○) 203 days of age at start of boar contact. .	- 98 -
Figure 3.2.1 Grower room, pens with a space allowance of 1.2m ² per gilt..	- 110 -
Figure 3.3.1 Concentrations of A) IGF-1 and B) Oestradiol E2 in plasma samples collected from 160 day old, LIGHT and HEAVY gilts. ^{ab} Superscripts indicate significant difference (P < 0.01).	- 122 -
Figure 3.3.2 Relationship between ADG from 70 to 161 days of age and the number of 3 – 6 mm follicles present on the ovaries of LIGHT (×) and HEAVY (■) 161 day old, non-cycling gilts. The fitted line and equation relate to HEAVY gilts only	- 125 -
Figure 4.3.1 Relationship between age and liveweight at puberty for Experiment three. Closed squares (■) represent HEAVY-HIGH gilts, closed triangles (▲) represent HEAVY-LOW gilts, open squares (□) represent LIGHT-HIGH gilts and open triangles (Δ) represent LIGHT-LOW Gilts	- 162 -
Figure 4.3.2 Cumulative proportion of gilts, in experiment three, attaining puberty in response to twice daily contact boar contact. Closed squares (■) represent LIGHT-LOW gilts, open circles (○) represent LIGHT-HIGH gilts,	

crosses (x) represent HEAVY-LOW gilts, and closed triangles (▲) represent HEAVY-HIGH gilts. ^{a,b} Significant difference between LIGHT and HEAVY gilts ($P < 0.05$).- 163 -

Figure 4.3.3 Relationship between age and liveweight at puberty in experiment four. Closed squares (■) represent HEAVY-HIGH gilts, closed triangles (▲) represent HEAVY-LOW gilts, open squares (□) represent LIGHT-HIGH gilts and open triangles (Δ) represent LIGHT-LOW gilts- 173 -

Figure 4.3.4 Cumulative proportion of gilts, in experiment four, attaining puberty in response to twice daily contact boar contact. Closed squares (■) represent LIGHT-LOW gilts, open circles (○) represent LIGHT-HIGH gilts, crosses (x) represent HEAVY-LOW gilts, and closed triangles (▲) represent HEAVY-HIGH gilts. ^{a,b} A significantly lower ($P < 0.05$) proportion of LIGHT-LOW gilts were pubertal.- 174 -

List of Tables

Table 1.2.1 Effect of Oestradiol-17 β implants on mean serum LH concentrations (ng/ml) on day 2, 8 and 14 after ovariectomy of 120 and 150 day old pre-pubertal gilts (adapted from Berardinelli et al., 1984).....	- 16 -
Table 1.3.1 The effects of the presence or absence of olfactory bulbs on puberty attainment in response to 30 minutes of daily boar exposure commencing at 160 days of age (adapted from Kirkwood et al., 1981)....	- 23 -
Table 1.3.2 The attainment of puberty in gilts commencing boar exposure at 165 days of age, and receiving 30 minutes of daily contact with either a ovariectomised or an unoperated boar (adapted from Pearce et al., 1988).	- 24 -
Table 1.3.3 The effects of fitting gilts with snout masks on the attainment of puberty in response to full physical boar contact commencing at 160 days of age (adapted from Pearce and Paterson, 1989).	- 26 -
Table 1.3.4 The effect of visual, auditory, tactile and olfactory stimuli on gilt puberty attainment in experiments one and two (adapted from Pearce and Hughes 1987).....	- 27 -
Table 1.3.5 Gilt puberty attainment in response to daily contact with boars of a low or high sexual motivation*, commencing at 160 days of age (adapted from Hughes, 1994).....	- 28 -
Table 1.3.6 Effects of duration of boar exposure on gilt pubertal response (adapted from Hughes, 1993).....	- 30 -
Table 1.3.7 The effect of frequency of boar contact commencing at 160 days of age on the timing of gilt puberty attainment	- 31 -
Table 1.3.8 Mean concentrations of LH and LH pulse frequency during the period from 12 - 20 hours after ram introduction in ram-exposed ewe lambs and during the equivalent time period in non-exposed ewe lambs (adapted from Knights <i>et al.</i> , 2002)	- 33 -
Table 1.3.9. LH pulse frequency and mean LH concentrations in blood serum samples collected from gilts attaining puberty in response to continuous boar contact from 135 to 200 days of age (RESPONDERS), and non-exposed gilts (CONTROLS) (adapted from Kingsbury and Rawlings, 1993)-	35 -

Table 1.3.10 Puberty attainment in gilts reared under controlled light regimens and with or without boar contact (adapted from Paterson and Pearce, 1990)-	38 -
Table 1.3.11 Effects of gilt age at commencement of boar exposure on the interval to puberty, as well as gilt age and liveweight at puberty	40 -
Table 1.3.12 Effect of gilt liveweight and P2 backfat on age at puberty, when boar contact commenced at 170 days of age (adapted from King et al., 1989).....	42 -
Table 1.3.13 Effect of liveweight and P2 backfat at 145 days of age on age and liveweight at puberty attainment (adapted from Gaughan et al., 1997)	42 -
Table 1.3.14 Effect of liveweight and P2 backfat on the timing of puberty attainment in response to boar contact starting at 165 days of age (adapted from King et al., 1989)	43 -
Table 1.3.15 Means for age at puberty, growth rate and backfat of females selected based on either age at puberty or backfat at 105 kg (adapted from Nelson et al., 1990)	44 -
Table 1.3.16 Ovarian and uterine development in prepubertal gilts experiencing either 14 days of restrictive feeding (Restricted) or 7 days of restrictive feeding followed by 7 days of <i>ad-libitum</i> feeding (Repleted) (Adapted from Booth et al., 1996).....	47 -
Table 1.3.17 Changes in weight and backfat at weaning of parity one and three sows used in United Kingdom nutrition experiments between 1983 and 1993 (adapted from Edwards et al., 1998).....	52 -
Table 1.4.1 Time spent in specific follicle size categories from the primary to early antral stage of development (adapted from Morbeck et al., 1992) ..	55 -
Table 1.4.2 Concentrations of progesterone, androstenedione, and oestradiol (mean \pm SEM) in follicular fluid of different sized follicles following PMSG treatment to induce follicle growth (adapted from Ainsworth et al., 1980)-	59 -
Table 1.4.3 Relationship between the size of the oocyte and its ability to undergo Germinal Vesicle Breakdown (GVBD) and reach the Metaphase I (MI) or Metaphase II (MII) stages of the meiotic cycle (adapted from Motlik and Fulka, 1986)	64 -

Table 1.4.4 Relationship between follicle size, meiotic progression and blastocyst formation <i>in vitro</i> (adapted from Marchal et al., 2002).....	- 65 -
Table 1.4.5 Nuclear maturation rates and blastocyst formation rates of sow COC cultured in follicular fluid derived from small (SFF) or large (LFF) follicles and with or without FSH (adapted from Algriany et al., 2004).	- 67 -
Table 1.4.6 Nuclear maturation rate, fertilisation rate and blastocyst rate of oocytes aspirated from 2 – 5 mm follicles on ovaries with either < 10 follicles with a diameter of 2 – 5 mm or > 10 follicles with a diameter of 2 – 5 mm (adapted from Gandolfi et al., 1997).....	- 68 -
Table 1.4.7 Mean number of small (1 – 2 mm), medium (3 – 6 mm) and large (7 – 10 mm) follicles present on the right ovary of gilts on days 13, 15, 17 and 19 of the oestrous cycle (adapted from Clark et al., 1982).	- 70 -
Table 1.4.8 Individual follicle characteristics in the 14 largest follicles present on the ovary of one gilt on day 20 of the oestrous cycle (adapted from Grant et al., 1989).....	- 72 -
Table 1.4.9 Stage of meiosis of oocytes obtained from individual gilts at either 27 or 30 hours after the onset of oestrus (adapted from Pope <i>et al.</i> , 1990)-	74 -
Table 1.4.10 Effect of restricted feed intake during two periods of the luteal phase (day 1 –7 versus day 8 – 15) on subsequent ovulation and embryo survival in post-pubertal gilts (adapted from Almeida et al., 2000)	- 78 -
Table 1.4.11 Effect of feed intake, before and after mating, on ovulation rate, embryo number and embryo survival on day 12 of gestation in Meishan gilts (adapted from Ashworth et al., 1999a).....	- 80 -
Table 1.4.12 Effect of feed intake during the luteal and follicular phase on oocyte nuclear maturation and follicular fluid concentration of oestradiol on day 19 of the oestrous cycle (adapted from Ferguson et al., 2003).....	- 81 -
Table 1.4.13 Effect of feed intake during the luteal and follicular phase on plasma IGF-1 concentrations and LH pulse frequency (adapted from Ferguson et al., 2003).....	- 82 -

Table 1.4.14 Effect of mating gilts at their first, second or third oestrus on age and liveweight at mating as well as litter size and born alive at first farrowing.....	- 86 -
Table 2.2.1 Diet specifications, and timing of feeding each diet during each phase, from piglet creep to dry sow ration.....	- 92 -
Table 2.3.1 Days from start of boar exposure to puberty attainment, age, liveweight and P2 backfat at puberty for gilts that started boar exposure at either 161, 182 or 203 days of age	- 96 -
Table 2.3.2 Age, liveweight and P2 backfat at mating for gilts that started boar exposure at either 161, 182 or 203 days of age and were mated at either the first (pubertal) or second oestrus	- 99 -
Table 2.3.3 Ovulation rate, embryo number, and embryo survival at approximately day 20 post-mating for gilts starting boar contact at either 161, 182 or 203 days of age and first mated at either the first (pubertal) or second oestrus.....	- 100 -
Table 3.2.1 The number of gilts in each treatment group and experimental block at each measurement point (161 or 175 days of age)	- 109 -
Table 3.2.2 Components of stock solutions	- 114 -
Table 3.2.3 Number of <i>in vitro</i> matured oocytes from each treatment group that were selected for activation or fixed to assess nuclear maturation.....	- 116 -
Table 3.3.1 Liveweight, average daily liveweight gain, P2 backfat and MMD for gilts fed to attain either 70 kg (LIGHT) or 100 kg (HEAVY) at 161 days of age-	121 -
Table 3.3.2 Growth characteristics of gilts fed to attain a LIGHT or HEAVY target liveweight at 161 days of age and a LOW or HIGH target average daily liveweight gain from 161 to 175 days of age.....	- 121 -
Table 3.3.3 Concentrations of IGF-1 and E2 in plasma collected from 170 day-old LIGHT versus HEAVY and Low versus High gilts.....	- 123 -
Table 3.3.4 Number of surface antral follicles with a diameter > 1 mm, 1 - 2.9 mm (small), 3 - 6 mm (medium), or > 6 mm (large), present on the ovaries of 161 day old, LIGHT and HEAVY gilts	- 124 -

Table 3.3.5 Number of surface antral follicles with a diameter 1- 2.9 mm (small), 3 - 6 mm (medium), > 6 mm (large) or > 1 mm present on the ovaries of LIGHT versus HEAVY and LOW versus High non-cycling gilts at 175 days of age	- 126 -
Table 3.3.6 Proportion of surface antral follicles with a diameter of 1 - 2.9 mm, 3 – 6 mm or > 6mm to the total number of surface antral follicles greater than 1 mm in diameter present on the ovaries of LIGHT versus HEAVY and LOW versus High non-cycling gilts at 175 days of age.....	- 127 -
Table 3.3.7 Meiotic stage of in vitro matured oocytes obtained from small and medium sized ovarian follicles of 161 day old LIGHT versus HEAVY gilts-	129 -
Table 3.3.8 The development of parthenogenetically-activated oocytes from small and medium sized ovarian follicles from 161 day old LIGHT and HEAVY gilts	- 129 -
Table 3.3.9 Meiotic stage of <i>in vitro</i> matured oocytes obtained from small (1 – 2.9 mm) and medium (3 – 6 mm) follicles of LIGHT versus HEAVY and Low versus High non-cycling gilts at 175 days of age	- 131 -
Table 3.3.10 The development of parthenogenetically-activated oocytes from medium sized (3 – 6 mm) ovarian follicles from LIGHT versus HEAVY and Low versus High non-cycling gilts at 175 days of age.....	- 132 -
Table 3.3.11 Concentration of progesterone (P4), androstenedione (A4), testosterone (Testo), and oestradiol (E2) in follicular fluid samples collected from 1 – 2.9 and 3 – 6 mm follicles from LIGHT versus HEAVY non-cycling gilts at 161 days of age	- 133 -
Table 3.3.12 Ratio of steroids in the follicular fluid of 1 – 2.9 and 3 – 6 mm follicles collected from LIGHT versus HEAVY, non-cycling gilts at 161 days of age.....	- 134 -
Table 3.3.13 Concentration of progesterone (P4), androstenedione (A4), testosterone (Testo), and oestradiol (E2) in follicular fluid samples collected from 1 – 2.9 and 3 – 6 mm follicles from LIGHT versus HEAVY and LOW versus High gilts at 175 days old.....	- 136 -

Table 4.3.1 Liveweight (LW), average daily gain (ADG), P2 backfat and maximum eye-muscle depth (MMD) of 175 day old gilts fed to attain either a LIGHT or HEAVY liveweight at 161 days of age and a LOW or HIGH liveweight gain from 161 days of age to puberty	- 160 -
Table 4.3.2 Mean days to puberty, age and liveweight at puberty for LIGHT versus HEAVY and LOW versus HIGH gilts in experiment three	- 164 -
Table 4.3.3 Ovulation rate, ovarian weight and luteal weight at day 10 ± 0.3 post mating for gilts starting boar exposure at 175 days of age and mated at the pubertal oestrus in experiment three	- 166 -
Table 4.3.4 LW, ADG, P2 backfat and MMD of 175 day old gilts fed to attain either a LIGHT or HEAVY liveweight at 161 days of age and a Low or High liveweight gain from 161 days of age to puberty in experiment four.....	- 168 -
Table 4.3.5 Mean days to puberty, age and liveweight at puberty for LIGHT versus HEAVY and Low versus High gilts in experiment four.....	- 171 -

Abstract

Replacement gilts and early parity sows constitute a large, and increasing, proportion of modern breeding herds. Breeding herd profitability is therefore increasingly dependant on the efficiency of gilt management strategies as well as litter size at first farrowing; however, incidences of reproductive failures and small first litter sizes are common within cohorts of replacement gilts. Hence, this thesis had two primary aims which were addressed in four experiments; one, to identify whether the puberty stimulation and mating strategies developed for genotypes of 20 to 30 years ago are suitable for today's heavier yet leaner genotypes; and two, to better understand the influence of pre-pubertal growth rate and metabolic status on reproductive maturation, puberty attainment and potential litter size.

In experiment 1, 192 Large White/Landrace crossbred gilts were used to compare the effects on puberty attainment of commencing boar exposure at 161, 182 or 203 days of age, and the effect of first mating gilts at either the pubertal or second oestrus on ovulation rate and early embryo survival. Gilts were artificially inseminated at the allocated oestrus, with the reproductive tracts collected at 22.8 ± 0.4 days after first mating (mean \pm S.E.M), and the numbers of corpora lutea and viable embryos recorded. Delaying first boar contact until 182 or 203 days of age significantly ($P < 0.01$) reduced days-to-puberty and increased the proportion of gilts attaining puberty within 10 days of start of boar exposure. Gilt age at mating had no effect on potential litter size; however, there was a tendency for gilts mated at their second oestrus to shed 0.6 more ova, and possess one more embryo at day 20 of pregnancy.

Experiment 2 determined the effects of long- (chronic) and short- (acute) term moderate dietary restriction on ovarian development and oocyte developmental competence in 161- and 175- day old, pre-pubertal gilts. Both chronic and acute periods of moderate feed restriction reduced the number of medium follicles present on the ovaries of 161- and 175-day old gilts, as well as the proportion of

oocytes reaching Metaphase II *in vitro*. However, feeding level during the 14 days prior to ovary collection had the greatest effect on follicular growth and oocyte quality. Experiments 3 and 4 investigated the effects of the same dietary treatments on the timing of puberty attainment in response to boar exposure and potential litter size following mating at the pubertal oestrus. Chronic dietary restriction during the pre-pubertal period delayed puberty attainment, but the timing of the pubertal response was unaffected by acute, moderate dietary restriction of previously well-fed gilts during the period immediately prior to, and coincident with, boar exposure. Acute dietary restriction or repletion stimulated an increase or decrease, respectively, in pubertal ovulation rates; however, neither the number of viable embryo present on day 22 of gestation nor embryo survival were affected by the nutritional treatments used in these studies.

Overall, these results demonstrate that the timing and synchrony of puberty attainment is significantly improved when gilts first receive boar exposure at 182 days of age (or older). It is, therefore, concluded that sexual maturity, as measured by responsiveness to boar contact, occurs later in modern genotypes. It is also evident that within the age range investigated, delaying first mating until the second oestrus does not significantly increase either ovulation rate or embryo number at day 20 post-mating. Further, the current data provide the first evidence that despite profoundly affecting the size and morphology of the antral follicle pool as well as pubertal ovulation rates, subtle alterations in dietary intake have no affect on the number or proportion of embryos surviving the pre-and peri-implantation period. It is evident the litter size of gilts mated at the pubertal oestrus is not determined by the number of ova shed, with the current data demonstrating that increasing ovulation rates results in increased embryo mortality.

Declaration

This thesis is a record of original work and contains no experimental material which has been accepted for the award of any other degree or diploma in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text.

I give consent to this copy of my thesis, when deposited in the University Library, being available for loan and photocopying.

Acknowledgements

I am deeply grateful to my supervisors, Dr Dean Revell, Dr Megan Mitchell and Dr Paul Hughes for their continual guidance, support and encouragement throughout my candidature. Thank you all for your patience, your humour and your friendship. I have learnt so much from you all.

A special thanks goes to David McNeil, Wayne Tiffen and Brian Warneke for their assistance and patience throughout my experimental work, no matter how much it interrupted their daily routines. I am also extremely grateful to Dr Philip Stott for all his assistance as well as to Dr Chris Grupen and Dr David Armstrong for their help with oocyte *in vitro* maturation and activation.

Last, but not least, thank you to my friends and family for tolerating my continual absences from their lives, and for their emotional support throughout the course of this study.
