Acknowledgements

I would like to express my sincere gratitude and appreciation to everyone who has been instrumental in helping me through the course of my study,

Professor Wayne Sampson for his insights, thoughtful suggestions, expert guidance and unending patience.

Professor Grant Townsend for so generously sharing his expertise and knowledge in the field and his amazing ability to make simple sense of statistics.

Dr. John Kaidonis and Dr. Dryer for their continued support and guidance.

Dr. Toby Hughes for giving me so much of time and assistance with the data and statistics when I needed it most.

The University of Adelaide for awarding me the J L Eustace Memorial Scholarship in Dentistry.

The Australian Dental Research Foundation and the Australian Society of Orthodontics for Research and Education for their financial support of this research project.

My parents whose unconditional love and support I have enjoyed my whole life. My father who has shown me that anything is possible. My mother who has given me what I needed most this year, peace of mind (and divine food!). Thank you for giving up a year of your life, to be with us.

Aunty Rani for your unfailing love and support. Thank you for coming when we needed you.

My brother Ramanan, for the pep talks when I was down and the absolute confidence in me. I'm still trying out those mind maps lumpy!

My nangi Azzy, for your belief in me.

My darling husband Vishu, for making me laugh when I wanted to cry, for propping me up when I thought I couldn't stand and reminding me just how much I have in my life. These last three years would have been impossible without your love and support. Thank you.

And lastly, my baby girl Maya, whose smile alone is enough to make everything worthwhile.

2. Summary

This study investigated arch dimension changes associated with growth and tooth wear in Australian Aboriginals aged from age 8 to 15 years using 2D and 3D digital imaging systems.

Serial dental casts of Australian Aboriginals from Yuendumu were used in the study. The sample comprised 25 females and 24 males for whom casts were available at ages of 8, 12 and 15 years (a total of 294 dental study casts). The primary method of data acquisition involved obtaining digital photographs and digitizing the images using an Apple IIGS computer and customised software program. A subset of 40 dental stone models (5 individuals at ages 8, 12, 15 and 18 years) were duplicated and scanned using the Minolta Vivid 900 laser surface scanner at the DSIRO Laboratories, National University Singapore. The 3-D images were digitised using the Rapidform software package (Inus, technology, Seoul, Korea). Study variables included mesiodistal crown diameters, arch widths, arch depths and arch lengths.

Mesiodistal crown dimensions in males tended to be larger than those in females. All arch dimensions were significantly larger in males than females. Upper and lower Inter canine width increased from age 8 to age 12 years but did not change thereafter. Upper and lower intermolar widths increased with age from 8 years to 15 years while arch depth decreased. No significant reduction in arch lengths was

found from age 12 to 15 years. The two imaging systems were comparable in their measurement reliability, although the 2D method provided consistently larger crown diameters than the 3D method.

Changes in arch dimensions with age in the Aboriginal sample were similar to those reported for other populations. However, no measurable change was detected in arch length over time, even though the Aboriginals had abrasive diets that would be expected to contribute to interproximal wear. It was concluded that the 2D and 3D imaging methods were suitable for clinical use but would require further refinement for research projects aimed at assessing minor changes in arch lengths associated with interproximal wear.
