Sydney, September 27. Mr. Jolly, who was formerly in charge of the Federal Forestry School at Canberra, has accepted the position of State Porests Commissioner at a salary of £1,500.

SCIENTIFIC AND INDUSTRIAL RESEARCH.

ANIMAL PESTS AND DISEASES.

Melbourne, September 22. One of the matters on which the Council for Scientific and Industrial Research has decided to concentrate of forts is the investigation of animal posts and diseases. The Council has not been able to obtain any comprehensive ngares to show the total annual entailed through the various posts and diseases, but there is doubt that it runs into some mil lions of pounds. It is estimated that in a bad year the loss from the sheep blowfly pest alone is as much as £4,000,000.

Investigations on many of the most serious pests and diseases have aiready been initiated at one or other of the veterinary research institutes in the Commonwealth. Further progress in their control and eradication can generally be made only as a result of fundamental seemtific investigation as to the nature of the diseases, their causes and the agencies by which they are spread. The Council therefore convened a conference last month at Sydney of the leading veterinary pathologists in order to obtain advice as to what action could best be taken in the matter. The Vice-President of the Executive Council (Senator Pearce) states that as a result of the conference it has been decided to offer financial assistance to the veterinary research institutes in order to enable them to cmploy competent workers to carry out investigations on a number of problems which now cause great loss to pasteral industries.

For example, it is proposed that investigations shall be carried out at the Glenfield Animal Research Institute, New South Wales, on (a) paralysis in pigs, which occurs specially in young pigs being topped off for the bacon factory, and which is a matter of great concern to the dairying industry; (b) toxacmia plethora, which causes high mortality in the best lambs, and of which the cause is unknown; and (c) sterility in cows, which is also of very serious concern to dairy farmers. At the Sydney University veterinary department it is proposed to continue work on Braxy diseases in sheep, which occur under different names in several of the States, and also to initiate investigations on Cascous lymphandenitis in sheep, which is extremely prevalent in Australia, and which is becoming of serious importance in connection with the export of frozen sheep. At the Melbourne University veterinary research institute it is proposed to carry out work on bovine pleuro-pneumonia and tuberculosis in cattle, and in Adelaide on other

Senator Pearce states that the above proposals are in accordance with general policy of the Commonwealth Government, namely, that the Council for Scientific and Industrial Research shall utilise existing institutions wherever prac-The Council also hopes to cooperate in its work on animal problems with Dr. W. A. N. Robertson, the Direcfor of Veterinary Hygiene, Comomonwealth Department of Health, and with Mr. Alien, the veterinary officer of the Department of Trade and Customs. The question of investigations on the improvement of stock (animal genetics) is also under consideration by the Council. Tais is a matter of great importance to the dairying and beef export industries. The investigations would, however, involve substantial expenditure of money, and it would probably be several years bel a results of value could be obtained.

diseases.
