# Abstract

This thesis presents the results of measurements made by infrared cloud cameras installed at the Pierre Auger Observatory in Argentina. These cameras were used to record cloud conditions during operation of the observatory's fluorescence detectors. As cloud may affect the measurement of fluorescence from cosmic ray extensive air showers, the cloud cameras provide a record of which measurements have been interfered with by cloud.

Several image processing algorithms were developed, along with a methodology for the detection of cloud within infrared images taken by the cloud cameras. A graphical user interface (GUI) was developed to expediate this, as a large number of images need to be checked for cloud.

A cross-check between images recorded by three of the observatory's cloud cameras is presented, along with a comparison with independent cloud measurements made by LIDAR. Despite the cloud cameras and LIDAR observing different areas of the sky, a good agreement is observed in the measured cloud fraction between the two instruments, particularly on very clear and overcast nights.

Cloud information recorded by the cloud cameras, with cloud height information measured by the LIDAR, was used to identify those extensive air showers that were obscured by cloud. These events were used to study the effectiveness of standard quality cuts at removing cloud afflicted events. Of all of the standard quality cuts studied in this thesis, the LIDAR cloud fraction cut was the most effective at preferentially removing cloud obscured events.

A 'cloudy pixel' veto is also presented, whereby cloud obscured measurements are excluded during the standard hybrid analysis, and new extensive air shower reconstructed parameters determined. The application of such a veto would provide a slight increase to the number of events available for higher level analysis.

# Declaration of originality

This work contains no material which had been accepted for the award of any other degree or diploma in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text.

I give consent to this copy of my thesis, when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library catalogue, the Australasian Digital Theses Program (ADTP) and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

So many things I would have done  
But clouds got in my way  
I've looked at clouds from both sides now  
From up and down, and still somehow  
It's cloud illusions I recall  
I really don't know clouds at all

**“Both Sides, Now”, by Joni Mitchell**

I particularly wish to thank both of my supervisors, Assoc. Prof. Bruce Dawson and Prof. Roger Clay not only for their patient reading of my thesis, but their invaluable guidance and support throughout my PhD and honours studies. I have been very fortunate to have had such great supervisors watching over me these past few years and introducing me to the exciting world of ultra-high energy cosmic ray physics.

I wish to also thank Neville Wild and Dr Andrew Smith for setting up the hardware and software associated with the installation and automation of the cloud cameras. I also wish to thank Dr Andrew Smith for taking me under his wing during my trip to Argentina in 2007, and allowing me to work with, and see first-hand the cloud cameras that I was spending so much of my time on. His anecdotal stories of some of the faculty members provided me with much entertainment on the long flights to and from South America.

I wish to thank all of my family and friends for helping support me both financially and emotionally during my PhD studies. I would have found my studies much more difficult, if not impossible without their unconditional support.

Many people have helped me during my studies it is impossible to thank you all individually for your contribution. So finally, I wish to send out a big thankyou to all of these people - every person I have worked with or alongside over the past few years, and every person who has contributed something, great or small to my time working with the cloud cameras at the Pierre Auger Observatory.
