Dear Professor Fisher,

On p.116 of your book, "Statistical Methods for Research Workers", (4th edition), you state that the test of significance appropriate to the question - might these samples have been drawn from different normal populations having the same mean? - has been found. I am interested in this problem, and should be obliged if you could inform me where the solution can be found; or if it has not been published, could you indicate the general lines of the solution?

Yours sincerely,

J. Lawwood
