March 27, 1942

Dear Hardy,

You may remember some time ago there was a certain amount
of trouble with the Secretary of the Cambridge Philosophical
Society about the test of significance put forward by a man called
Behrens, which, though not often wanted, appeared to me to be
correctly treated by that author, so far as the results obtained
are concerned.   Bartlett had made a number of objections to this
test.   Most of these seem now to have been withdrawn, but in
giving fuller tables of Behrens' integral, I have taken the
opportunity of examining them in relation to other cases of
statistical inference.

Yours sincerely,
