January 29, 1937

Dear Norton,

I am very glad to have your paper on the test of significance, based on scoring a discontinuous distribution, which I hope to put into the next number of Annals.

I have taken the liberty of adding a paragraph, on the analogy between the test used and   as used for combining probabilities, at the end of your first Section.   I enclose a copy of this note, since I do not think it is fully realised how sensitive to discontinuity this   test really is.

                                        Yours sincerely,
