

19th. November 1948.

My dear Rob,

Thanks for your note. We have had a bigger and better target made now with additional lines to show the subdivision allowed by Miss Ganger's serum.

Thank you for your further Lewis families. Does it not look as though Lewis positive women were secreting something which curls up Lewis positive sperm? If so I suppose something of the

same kind would have to be happening to the opposite homozygote.

By the way, have you checked up Mrs. Brown's case?

Hoping to see you on 30th.

Yours sincerely,
