

31st. January 1948.

Dear Race,

Thanks for sending me Haberman's paper which I am returning herewith, and which I am delighted to see as the first test of d on a satisfactory scale. Do you know whether the good quadron is supplying any more under the stimulus perhaps of R'R' injections? She really ought to be cultivated.

I suppose Haberman has decided already where he wants to publish, perhaps in some clinical journal in the States. I am

quite keen to give readers of Heredity an opportunity to follow these developments, at least on the genetic side.

I suppose Kaberman did not encounter any  $O^W$ . Table III shows none, though on page 5 he says he used it.

Yours sincerely,
