

2nd. July 1947.

My dear Race,

Thanks for your letter and the screed, which I am returning herewith. I think it makes a very good story, and had not realised that the crossover frequencies behaved so amiably in the second series. I like your use of chromosome frequency, and think it is exactly right. I enclose a little note anent your first page, which I hope you will think worth using.

Yours sincerely,

Fisher did not discover the six elementary antigens , the existence and relationships of which were suggested to him by long discussions with Taylor, Race and Cappel, based on the serological findings of Taylor and Race. I suggest the best amendment would be to replace "Fisher's discovery" by "the discovery", allowing "Fisher" to stand in the following paragraph.
