

14th April, 1947.

My dear Bob,

Thanks for sending me your fifty Latvians. I wonder if you have looked at the simultaneous classification for P sera, as these are a bit queer. The most striking are shown by the following table -

	O	B	A ₂ B	A ₁ B	A ₂	A ₁	Total
no	8	12	1	0	0	0	21
P	2	4	1	3	2	17	29
	<u>10</u>	<u>16</u>	<u>2</u>	<u>3</u>	<u>2</u>	<u>17</u>	<u>50</u>

This looks as though your fine new P serum was full of d. What do you think?

Another thing that looks queer is the distribution -

	Expected	Observed
EE	2.643	7
Ee	17.710	9
ee	29.645	34
	<u>50.000</u>	<u>50</u>

In this connection there seems to be an association with B for one has -

	B	not B	Total
ER	0	7	7
Ee	3	6	9
ee	18	16	34

Well I suppose that is enough to trouble you with at one time.

Yours sincerely,
