

27 September 1934.

Sir Humphrey Rolleston,  
Martin's,  
Scotlands Lane,  
Haslemere.

Dear Sir Humphrey,

Since coming to the Galton Laboratory I have been extremely anxious to establish research there on the hereditary serological differences found in man, to which attention was first called by the discovery of the blood groups, but which appear <sup>really</sup> rarely to be much more numerous.

I have succeeded in interesting the Rockefeller Institute in a small research programme which could be, I think, within the compass of this laboratory, but for it I should need to find a young medically trained man, well qualified for research and anxious to take up studies in this field. I understand that serological technique is not very widely taught, and I should be glad of your advice to whom I could usefully apply to get in touch with suitable candidates for the post. We have in mind a salary scale rising from £650 to £800. If you could do anything to help me in this it might make the

difference between the success and failure of a promising line of research and I should, in any case, be glad of your advice.

Yours sincerely,
