ABSTRACT

The transition to university has been described as a “battle” for students as their ways of learning are challenged and threatened. Most students transitioning into Medicine at the University of Adelaide encounter the Case-based Learning (CBL) approach, used across the whole curriculum, for the first time. The transition experiences of students across various university programs have been investigated but not for students entering medical programs. A Transition Pedagogy model which integrates co-curricular and curricular components provides a framework for investigating the complexities of the environment experienced by transitioning students. The framework designates key strategies in four dedicated areas that extend across six curriculum principles. The purpose of this study was to investigate strategies used in these four areas by transitioning students, academics and administrative staff in the specific context of a CBL medical program.

A mixed-methods research design was used. Students, academics and administrative staff completed questionnaires and participated in Focus Groups. Students completed the “First Year Experience Questionnaire” (FYEQ) for comparison with a general cohort of first year university students studying at nine Australian universities. Students’ distress levels were measured two weeks before examinations in Semesters One and Two. Students and tutors completed questionnaires to investigate the alignment of their perceptions about the Case-based Learning approach. Tutors completed the “Approaches to Teaching Inventory” to investigate the relationship between a student’s perceptions of the CBL approach and their tutor’s approach to teaching. Focus Groups explored questionnaire findings to generate a deeper understanding of the strategies employed by students, academics and administrative staff involved in the transition process.

Although medical students scored significantly higher than the general cohort of first year university students in four domains of the FYEQ, namely sense of purpose, student identity, course satisfaction and being prepared and present, they scored significantly lower on the domain comprehending and coping. However, these results did not apply to international medical students. This provided an unanticipated avenue of investigation which established that international students were receiving more effective orientation and scaffolding for transition than domestic students in the four areas of the Transition Pedagogy model. Evidence highlighted the need for professional development for CBL tutors to include mentoring for new tutors, peer review of teaching and the principles and practice of appropriate orientation and scaffolding for transitioning students.

The Transition Pedagogy model provided an effective framework for investigating the first year experience for medical students, and the comparison between the learning experiences of international and domestic students demonstrates how a first year curriculum could be implemented in a way that improves the transition experience. To achieve a third generation approach that embraces co-curricular and curricular components, a transition pedagogy for medical students should be organised in a systematic manner that begins with policy changes at the level of governance and involves changes in practices of preparing students for the *process* of Case-based

Learning, through extended orientation and the provision of scaffolding to develop the skills essential for self-directed learning.

CERTIFICATE OF THESIS ORIGINALITY

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis, when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library catalogue and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

ACKNOWLEDGEMENTS

There are many people who have enabled me to undertake the research and complete the writing of this thesis, but firstly I must thank my three supervisors. Under their patient guidance and support, my knowledge and skills in medical education research have increased significantly. Professor Anne Tonkin, as my main supervisor, was especially encouraging in the early days of my research when at times it seemed impossible that I would complete my thesis. Professor Ray Peterson and Professor Alison Jones have given many hours of their time in discussions about medical education. They have always been available to share their wisdom and knowledge, and I always left our meetings feeling supported and encouraged. I am grateful for the high standards that each of my three supervisors set for my research.

I would like to thank Jonathan Salmon for the IT support he has provided with data analysis and presentation, and Dr Nancy Briggs (Statistician in the Data Management & Analysis Centre in the Discipline of Public Health at the University of Adelaide) for her assistance and support with the data analysis. My knowledge and understanding of statistical analysis increased rapidly under her excellent guidance.

Thanks must also go to staff in the Barr Smith Library at the University of Adelaide: Ms Lucy Zuzolo, Reference Librarian, for assistance with the EndNote program to collate references and Dr Michael Draper, Research Librarian, for help with searching for literature relevant to my research topic. Invaluable advice about formatting my thesis was provided by Ms Brigitte Slood and Ms Helen Foster, IT Training Officers in Technology Services at the University of Adelaide.

I am grateful to Professor Richard James (Professor of Higher Education and Director of the Centre for the Study of Higher Education, the University of Melbourne) for permission to use the First Year Experience Questionnaire (personal communication 2 June 2010), and to Professor Malathi Srinivasan (Assistant Professor of Medicine, University of California, Davis, School of Medicine, Sacramento, California) for permission to use a modified version of his questionnaire on Case-Based Learning perceptions.

I would also like to thank all participants (first year students of the 2011 medical program, CBL tutors and academic and administrative staff of the Medicine Learning and Teaching Unit) for their interest and enthusiastic responses which helped to make this research possible. There was an excellent response rate to all the questionnaires and no shortage of volunteers for the focus groups, which provided lively and informative discussions.

Finally I would like to thank my husband Jim and all my family for their belief in me that I could undertake and complete this thesis.
