Statement of Declaration

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis, when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

STATEMENT OF DECLARATION

To my family

Abstract

Improving the efficiency of solar cells is an active area of research in photovoltaic industry. The research work presented in this dissertation is based on a quest for better and improved silicon solar cells. The current work aims to explore different possibilities by studying advance approaches for PV applications. Additionally this work is intended to seek the feasibility of new photonic concepts for improving silicon solar cells.

In this work we have investigated solar downconverters consisting of tellurite glass. Their fabrication process is discussed followed by the experimental characterization. Optical measurements such as absorption spectra, fluorescence spectra and fluorescence quantum efficiency are undertaken. These optical measurements enabled to understand physical processes associated with the materials used.

Furthermore, the work presented in the thesis is focused on the realization of a downconverter. The work can be roughly sub-divided into two parts. One part identifies the suitable energy conversion materials and the second part deals with the development and demonstration of the experimental method for characterizing a downconverter. The final part of the work extends investigation for more efficient materials prior to their use at the practical level. We also propose an architectural design for the efficient use of a downconverter with a silicon solar cell.

ABSTRACT

Acknowledgements

First of all, I would like to thank my principal supervisor, Jesper Munch, for the opportunity to be a part of his group and to be able to work on an interesting problem. I am grateful for a number of discussions and meetings as well as encouragement, care and support. I acknowledge his efforts and guidance to accomplish this work. I thank him for proof-reading of the thesis during write-up. And of course his mentorship enriched in me will stay forever.

I am very grateful to my co-supervisors, Murray Hamilton and Heike Ebendorff-Heidepriem, for their guidance throughout the work. I am highly thankful to Murray, for the provided support, assistance, many fruitful discussions, suggestions and corrections on thesis. I greatly appreciate Murray for his constructive ideas and provided necessary experimental equipment. Also I greatly thank to Heike for the provided samples to undertake investigation. Her help on sharing knowledge of glass materials at the early stage of the project was really useful.

I thank to Nigel Spooner for giving me access to his lab and lending me spectrometer and many optical components for the experimental measurements. I enjoyed on some occasions sharing ideas on experimental equipments.

I must acknowledge fruitful talks and support from David Hosken. Many thanks to the people in Optics group Peter Veitch, David Ottaway, Keiron Boyd, Miftar Ganija, Nick Chang, Ori Henderson, Ka Wu, Lachlan Harris, Nicky Huichao, Myles Clark, Sophie Hollitt, Eleanor Jeans, and Simon Curtis for their friendly talks.

I would like to thank Stephen, Erik, Mariusz, Nathan and Manuel for their friendly talks with me around the Physics department.

ACKNOWLEDGEMENTS

I also thank the people in the Physics workshop for their technical support, especially Blair Middlemess, who always prepared components as a part of my experimental setup.

I also acknowledge The University of Adelaide for the award of university research fee scholarship and other facilities to continue further studies.

On the personal side, there are many people in the family to whom I would like to thank for their continued support and best wishes. In particular, I wish to thank my Uncle, Muhammad Zia who was very kind, generous and helpful throughout my stay at Adelaide. He has always supported financially and encouraged me to persevere with research studies.

Last but not the least I would like to thank my parents who have been kind, loving and praying for me all the time. Without their support and financial help, it would not have been possible to achieve this goal. Special thanks to my sisters and a brother for their continued support, sharing joys, and encouragement. I truly wish you all the best for the whole of your lives.

LIST OF TABLES

List of Abbreviations

Throughout the thesis, several abbreviations will be used to represent specific short descriptions or notations, the following is a list for the readers convenience. This list is not exhaustive but every effort has been made to maintain conformity of notations used here.

| | |
|-------------|---------------------------------|
| AM | Air Mass |
| ARC | Anti-reflection coating |
| BP | Band-pass |
| CdTe | Cadmium tellurite |
| CIGS | Copper indium gallium arsenide |
| DC | Downconversion |
| DS | Downshifting |
| ECL | Escape cone loss |
| EQE | External quantum efficiency |
| FQE | Fluorescence quantum efficiency |
| FTIR | Fourier transform infrared |
| IPV | Impurity photovoltaic |
| IQE | Internal quantum efficiency |
| LED | Light emitting diode |
| LP | Long-pass |
| NIR | Near-infrared |
| NPR | Non-radiative phonon relaxation |
| OFD | Organic flourescent dyes |

LIST OF ABBREVIATIONS

| | |
|------------|---------------------------|
| PCE | Photon cascade emission |
| PV | Photovoltaics |
| QC | Quantum cutting |
| QD | Quantum dot |
| QS | Quantum splitting |
| RE | Rare-earth |
| SC | Solar cell |
| Si | Silicon |
| TIR | Total internal reflection |
| UC | Upconversion |
| UV | Ultraviolet |
| Vis | Visible |
| VUV | Vacuum ultraviolet |
