SCIENTIFIC RESEARCH.

New Zealand Activities.

Chat with Professor Denham.

Interesting information concerning agricultural research work in New Zealand was given by Professor H. G. Denham, of Canterbury College, who arrived in Adelaide on Tuesday, and is the guest of Dr. S. W. Pennycuick, at 27 Tynte street, North Adelaide. Professor Denham was shown over the Waite Agricultural Research Institute in the morning by Professor Richardson, and subsequently he remarked that he had been greatly impressed by the magnificent work being done at Urrbrae. During the next five years there should be a fund of information available for the more effective utilization of the pastures of Australia. The programme, for example, in connection with the effect of top dressing of pastures was likely to be productive of immense good in the near future. New Zealand was, of course, up against the same problems, although other factors, such as lime deficiencies in certain soils, also entered into the question, and they proposed to follow up somewhat similar lines of investigation into their own pastures. Asked whether the Dominion had a like institution, the professor said that the Cawthron Institute at Nelson was similarly endowed. They were sorry to lose Dr. Tillyard, but they recognised that in his new sphere as Federal Entomologist the doctor would have a bigger field for his activities, and from the assurance given by Professor Rivett they felt that they would still have the benefit of Dr. Tillyard's advice. His work on woolly aphis had meant a clear benefit to the Dominion of £40,000 a year, for he had completely eradicated that pest in the orchard districts of New Zealand. The Cawthron Institute had done fine work on various fruit diseases, including the tomato. The agricultural chemist there had rendered considerable help to farmers in certain localities surrounding the institute. Of course, he had made a thorough soil survey of the whole district of Nelson, and was in a position to advise farmers promptly with respect to the treatment of their land.

Pronounced Progress.

Professor Denham is a member of the New Zealand Department of Scientific and Industrial Research, which, he said, had been in operation for 15 months. They had established a dairy institute to investigate problems affecting that industry, and a full-sized factory and herd would be attached to it. The building was now being erected, and the work would be undertaken immediately. A dairy chemist, who had been appointed to take charge of the work, was at present undergoing special training in England. This particular institute would be worked in conjunction with the Massey Agricultural College at Palmerston North. The department further proposed to establish in the near future an institute for seed and plant work, and were also taking up the question of mineral deficiencies in various pastures throughout New Zealand where definite diseases of stock had taken place. This work would be based upon lines similar to that in vogue at the Waite Research Institute—the determination of the types of plants present in the pastures and their nutritive value at different stages of their life history, in an endeavour to ascertain the most profitable time to feed stock on various pastures. "Another branch of work which we have running there," Professor Denham added, "will be with regard to diseases of various seeds. As a matter of fact, promising results have been achieved already by the Government Mycologist in the control of turnip disease, which has been shown to be seed borne and of smut in wheat, and particularly barley. Experiments are being conducted by treating barley, seed with hot water at definite temperatures, and there has been a remarkable increase in the yield—and still more advance in the quality of the grain—not only from seed treated in this way, but also from seed gathered from well treated material. Immunity from disease has remained over to the following season. For instance, the average quantity off 500 acres of barley untreated varies from about 70 to 75 per cent. first grade, from 18 to 20 per cent. second grade, and 5 per cent. third grade. Seed treated by that method gives practically 99 per cent. first grade. This is only the result of one season's work and there are other factors to be considered yet, such as climatic conditions, which are beyond control.

Wheat Improvement.

"We are also considering the question of framing regulations for the Government control in respect to the production of wheat for milling. Farmers, millers, and bakers have been brought together, and are putting up a definite contribution based upon the amount of wheat or flour
