

Operationalizing Resilience

Conceptual, Mathematical and Participatory Frameworks
for Understanding, Measuring and Managing Resilience.

Thesis Declaration

I, Ariella Helfgott, certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

The author acknowledges that copyright of published works contained within this thesis resides with the copyright holder(s) of those works.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

This thesis is dedicated to Arieh and Annita Helfgott,
to whom I owe my resilience.

Acknowledgements

This thesis has been 10 years in the making and there are many people, who have shaped my thinking and my life during that time, that I cannot thank enough. My deepest thanks go to my primary supervisor, Professor Nigel Bean, without whom this work simply could not have happened. Nigel's willingness to support truly exploratory, interdisciplinary research enabled this thesis. He was constantly present, available, supportive, encouraging, and never once became impatient throughout a very exploratory, lengthy and risky journey that travelled well outside of his own disciplinary specialties and interests. Nigel has been with me every step of the way and has contributed to my thinking in each aspect of this thesis. My second supervisor, Dr. David Matthews, provided crucial insight and inspiration through his own work on systems thinking. I owe much of my own thinking on systems thinking to him. My third supervisor, Dr. Matthew Roughan, had a significant role in the early days of this thesis, supporting my exploration of complex systems science as it relates to resilience.

I am grateful to the School of Mathematical Sciences for providing me with a PhD scholarship. I am also grateful to the Defence Science Technology Organisation (DSTO) within the Australian Department of Defence and to the Environmental Change Institute (ECI) at the University of Oxford, which both provided me with stimulating work environments through which I further developed my thinking and practice. My employment at the ECI provided me with the opportunities to apply for large research program funding, which gave rise to the Systemic Integrated Resilience and Adaptation (SIRA) research program.

I am extremely grateful to CCAFS for their support of the SIRA research program, particularly Dr. Andrew Jarvis, Dr. Osana Bonilla Findji and Dr. Sonja Vermeulen, who provided intellectual feedback and practical support as well as funding. At the same opportunity, I must thank the SIRA team: Chase Sova, Meghan Bailey, Jessica Thorn, Abrar Chaudhury and Adeyemi Ademiluyi, who worked together with me as an interdisciplinary team to apply the frameworks presented in this thesis in Nepal and Ghana. They took part in organizing and facilitating the participatory action research activities described in Chapters 5, 6 and 8.

I am indebted to Dr. Steven Lord for his contribution to the mathematical framework for resilience that corresponds to the conceptual and operational frameworks presented in this thesis. The process of developing the mathematical framework together greatly shaped my thinking on resilience. Steven has provided razor-sharp feedback and insight on many relevant topics, including scenario development and Fuzzy Cognitive Maps.

I have a profound sense of gratitude to my ECI and CCAFS colleague, Dr. Joost Vervoort, who is the Principal Investigator of CCAFS Regional Scenarios program. Joost and I have worked seamlessly together across 8 countries over the past 4 years to integrate the SIRA and regional scenarios programs. Joost and I have co-facilitated workshops for both programs. This collaboration has been highly stimulating and educational and I am grateful for the support and inspiration Joost has provided.

The mode of research undertaken in this thesis has been greatly influenced by the example my father set in his own work. He taught me to relentlessly pursue rigorous understanding

of a topic, even if it meant I had to acquire new knowledge, skills, and engage with new disciplines and sectors and chart unknown territory. I am grateful to both of my parents for providing me with an excellent education, both formally and informally, and instilling in me the values and the habits which have allowed me to undertake my work and to write this thesis. This thesis is dedicated to them, since I owe them my personal resilience.

I thank Professor Terrance Hughes for introducing me to the concept of resilience and setting me on this path. Though the work we did together with Dr. Sean Connolly and Dr. Andrew Baird, mathematically modelling the resilience of the Great Barrier Reef, falls outside of the scope of this thesis, the process we went through together greatly informed my subsequent work, which is described here.

I thank Jennifer Russell for kindly proofreading and copyediting this thesis, and for providing a great deal of encouragement and support throughout this process. I thank Mavra Design for typesetting, cover and chapter divider design.

Abstract

We live in a turbulent world, in which there is growing awareness and concern about of unpredictable and interconnected change across scales. We cannot predict, still less control every source of change that affects systems on which we depend. However, we can aspire to be resilient in the face of change. We can seek to build resilience so that when disturbances happen, those systems have the capacity to absorb, adapt to, utilize and possibly even benefit from perceived disturbances. We can seek to manage systems such that, when they do fail, they fail gracefully; and such that we can effect desirable transitions and transformations. This thesis presents a practical theory of system resilience to facilitate improved management and governance of systems such that their capacity to sustain human and natural capital is enhanced. In order to do so, it addresses questions of what system resilience is, how it is measured, how it is created or destroyed and what we can do, as humans, in order to manage resilience. It provides direct methodological pathways from conceptual and mathematical models of resilience to approaches for characterizing and managing resilience on-the-ground.

Resilience has received an enormous amount of attention across an extensive range of disciplines and sectors. It has become a central theme of research, policy and practice from local to global scales. However, the global spread of resilience has not resulted in global definitions. The inherent conceptual and operational pluralism extant in the field is problematic for those involved in resilience management, planning and decision-making; particularly in the multi-actor and multi-scale processes that are called for by the very concept of resilience. Acknowledging interconnectedness of social, economic, political and environmental systems across scales and levels, taking into account cross-scale and cross-level interactions, and striving towards holism are fundamental aspects of the resilience approach. Thus, frameworks that can handle this diversity across disciplines, sectors and social worlds scales are needed. This thesis has presented systemic frameworks for understanding, measuring and managing resilience that are designed to work with and capitalize on this inherent pluralism and accordingly build capacity to cope with uncertainty and change.

The frameworks presented have been applied tested by the author through the Systemic Integrated Resilience and Adaptation program. Applications to understanding and managing the resilience of agricultural communities in Nepal, for integrated multi-level resilience and adaptation in Ghana and a global level food systems model. Relevant resilience planning frameworks and the approaches taken to cross-level, cross-scale and cross-research program integration have been described. Finally the frameworks are applied to the design and implementation of interdisciplinary resilience research programs. The lessons learned from these applications are discussed, guidelines for understanding, measuring, managing and researching resilience are provided and directions for further research and action are highlighted.
